Splitboard Skins

TRIMMING INSTRUCTIONS

Climbing skins should not exceed the running surface of the board. If your skins exceed this length, trim with scissors or the included trim tool. If the width of the skin exceeds the width of the board, center the skin on the board half and use the metal edge as a guide for the trim tool when trimming width.

It is also acceptable to trim the tail of the skin to match the curved contour of the tip of the skin where the tip loop is attached. This will prevent any glue from being exposed when the skins are folded glue to glue.

STORAGE & USE

- 1.) Always store skins folded, adhesive side to adhesive side.
- 2.) Do not store in temperatures above 90°F [32°C]
- 3.) Pull the skins apart before applying them to your skis. Rub your hand down the length of the skin to create heat and improve adhesion.
- 4.) On cold days, store your skins inside your jacket to keep them warm and to increase adhesion.
- 5.) Avoid getting snow on adhesive and keep ski bases as dry as possible before applying skins.
- 6.) In the spring, when the snow is warm and wet, it may be necessary to apply skin wax. We recommend Ascension Glop Stopper.
